This is a simplified wording draft prepared on October 31, 2026. It does not replace evidence of instructor approval for the original proposal.

Project idea

Movement Quest is an offline workout logbook. A user can save plans, record exercise sets and review workout history. I changed my earlier Trail Tales idea because its route tracking and safety warnings did not fit the topic. Movement Quest stores what the user enters and gives no health advice.

What the user enters

A workout plan has a title, equipment, an optional note and an effort level from 1 to 5. A set has an exercise and reps. The current version also supports an optional weight in pounds and a Barbell equipment tag.

What the app shows

The app shows saved plans, an equipment filter, workout history, total reps and a finished-workout count. Users can create, edit and delete both plans and sets. Settings saves preferred equipment, default effort, dark mode and the option to show or hide Gear Match.

Screens and navigation

The five screens are Plans, Create or Edit Plan, Workout, History and Settings. Plans, History and Settings are tabs. Selecting a plan opens Workout. New Plan and Edit Plan open the plan form. Workout lets the user Start, Log set, Finish or Reset. History lets the user correct or delete saved sets.

Storage

SQLite stores the plans and sets in two linked tables. Each set belongs to a plan. Deleting a plan also removes its sets after confirmation. Settings uses SharedPreferences. The app does not need a cloud database or internet connection.

Counting workouts

Several sets can belong to one workout. All sets in that workout share a sessionKey. The app counts distinct finished session keys rather than counting every set as a separate workout. Reset removes only unfinished sets from the current session. Adding the weight column must preserve older saved sets.

Gear Match

Gear Match suggests a saved plan using fixed rules. Matching the preferred equipment adds 2 points. Choosing a plan different from the last finished plan adds 1 point. The lower ID wins a tie. The baseline uses equipment matching only. The suggestion explains its points, and the user can ignore or disable it.

The helper cannot know what the user wants today. A saved Dumbbells preference can still suggest Dumbbells when the user wants Mat. This is a known limit.

Testing

The test plan covers form validation, both entities' saved records, deleting linked records, session counting, settings, the schema upgrade and helper cases. Offline checks should save records and a setting, close the app, reopen it and confirm the saved values on two devices or emulators. A test should also leave the screen while a save is running. Results belong in the final report.

Project work and submission

Mario is the only member of Team Fitness. GitHub stores the code and tests. ClickUp should record the tasks, dated board snapshots and task-to-code/test evidence. The board URL and required evidence PDF still need to be supplied.

The assignment checkpoints were October 18 for the proposal, October 21 for UI/navigation, October 24 for core functionality and October 28 for final submission. These dates are the original schedule, not a claim that approval or submission occurred on those dates.

The final package needs the release APK, approved proposal, report, signed statement, questions-only Word document, PowerPoint, helper documentation, ClickUp evidence, repository link and video link.
